

# MotherWEB

Version 1.8  
Coded by DCHKG  
Released by the UGMPT

**MotherWEB** is a new network utility built for Mac OS X and being coded and released by DCHKG (active member of the Underground Mac Programming Team). It's based on the web module of **Heirophant 3.7**. It is able to find out interesting links into web pages. You choose an URL, the file extensions you want to ignore or the ones you want to filter and when you push «RETRIEVE LIST OF GOODIES» then it lists the links to the targeted files. Then you're able to download every single file or all at once. File download resuming is supported.

Please read the following tutorials about the automate function :

- \* MotherWEB – automate – ADD GENERATED GOODIES URLS TO LIST ;
- \* MotherWEB – automate – GET GOODIES FROM GENERATED URLS.

## VERSION HISTORY

- Version 1.8 : bugs fixed.
  - [major bug fixed] : ability to retrieve goodies within Javascript code ;
  - [feature improved] : universal binary release.
- Version 1.6 : bugs fixed.
  - [major bug fixed] : http error 404 support relative bugs ;
